Problem: Unstructured Data Retrieval and Manual Entry

So, prices and come in through emails that have varying structures and methods of dumping rate and price data. Because someone has already typed this into their computer and sent it to us, having to manually type it in again is inherently inefficient. We would like to see more automation in terms of prices and rates being sent in and cataloged. Without this automation, we increase our liability. If all data is controlled by computers 100% of the way once it hits DST and mistakes that occur are likely caused by those who send price and rates in, whereas humans are much more likely to add a digit, miss a decimal or just mess up in general. As it stands, there is too much variation in how manually entered data ispresentedtopricers. Emails,pdfs, and spreadsheets come in, allvaryinginlayout.
